### **Executive Summary**

Over the past three years there have been no clear trends of seeding system or nutrition regime on grain yields, quality or gross margins. Although this period of work was characterised by below average seasons, the 9-year length of the project has provided similar findings.

Soil and plant testing throughout the project have shown no distinct differences as a result of tillage system or nutrition level.

However, reduced tillage systems are very efficient and have been widely adopted due to operational advantages that a one-pass sowing system provides in terms of time and labour.
